

Validate Before Commit: safe, label-efficient readaptation for adaptive NIDS

Detection $\neq$ decision: the benefit of retraining tracks deployed-model degradation ($r \approx -0.85$) — a quantity drift detectors cannot see.

~8 labels / confirmed drift • probes up to 20 windows stale • fails safe under 40% label flips
2 detectors × 4 downstream classifiers • pre-registered, 30-seed 95% CIs • reproducible artifact
